# Context for Engagement

Design your own contextual apps

For Android & iOS

{trnql}

# Hi, I'm Naz!

**Past** - **Android** DevRel @ **Google**

- Google IO13 &14 - UXD Workshops
- Udacity Class on Designing for Mobile
- UXD show on YouTube

**Currently** - CEO & Founder of trnql - <http://trnql.com>

**Why I'm here** - Increasing User Engagement by Designing & Building smarter apps that are contextually aware

# What is context?

**Basic** - Who, Where?

**Advanced** - Is your user walking or driving, happy or sad, hot or cold, near or far from something or someone relevant?

# What is context?

## How to determine context? Sensors!

- GPS, Accelerometer, Gyroscope, Magnetometer
- Proximity, Ambient Light, Barometer, Thermometer, Camera
- Pedometer, Fingerprint & Heart Rate Monitor, Microphone

## Examples:

Messaging app can take keyboard away when user is moving and replace it with voice input

Navigation app can show walking directions if user is walking vs. driving directions if they are in vehicle.

# What is context?

## How to determine context? Data!

- Data from device storage (calendar, contacts, etc.)
- Data from web services (weather, neighborhood safety, etc)

## Examples:

Messaging app can use calendar to determine free/busy before interrupting user with a notification

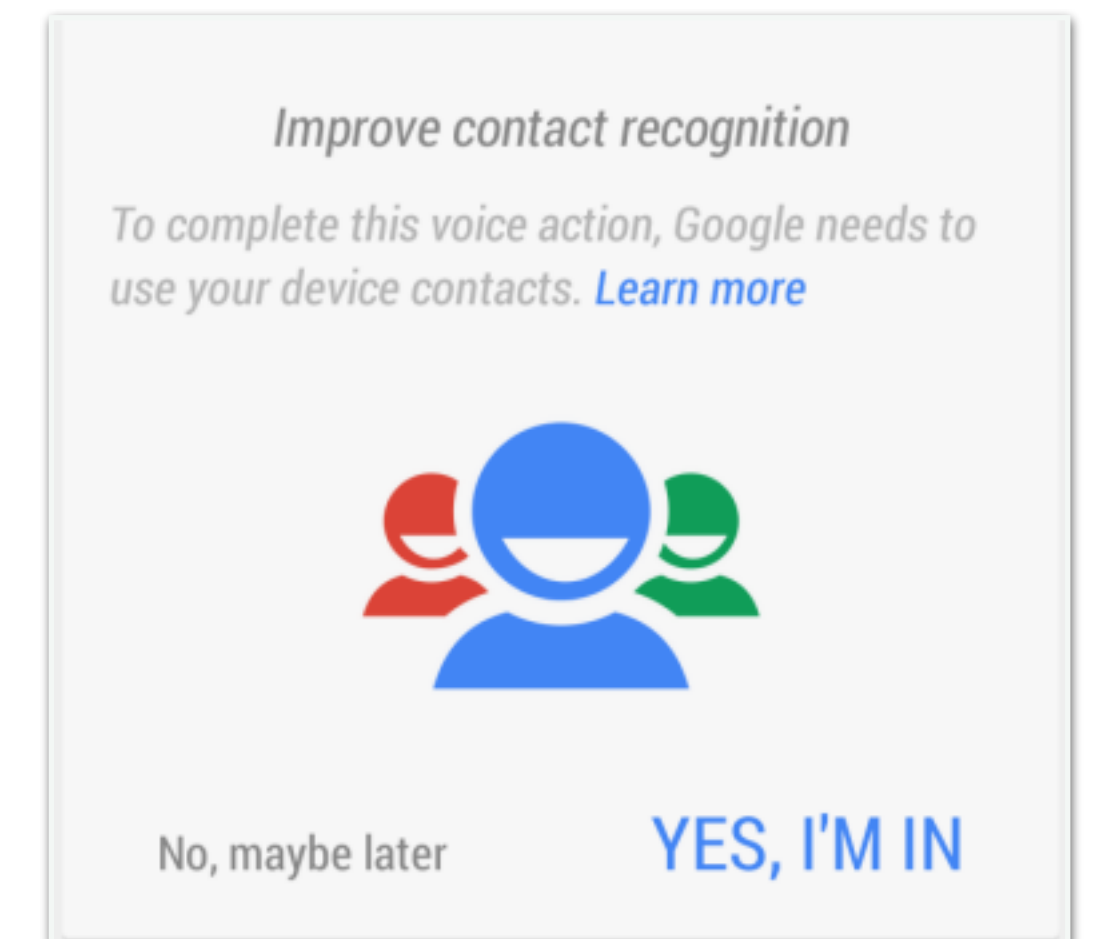

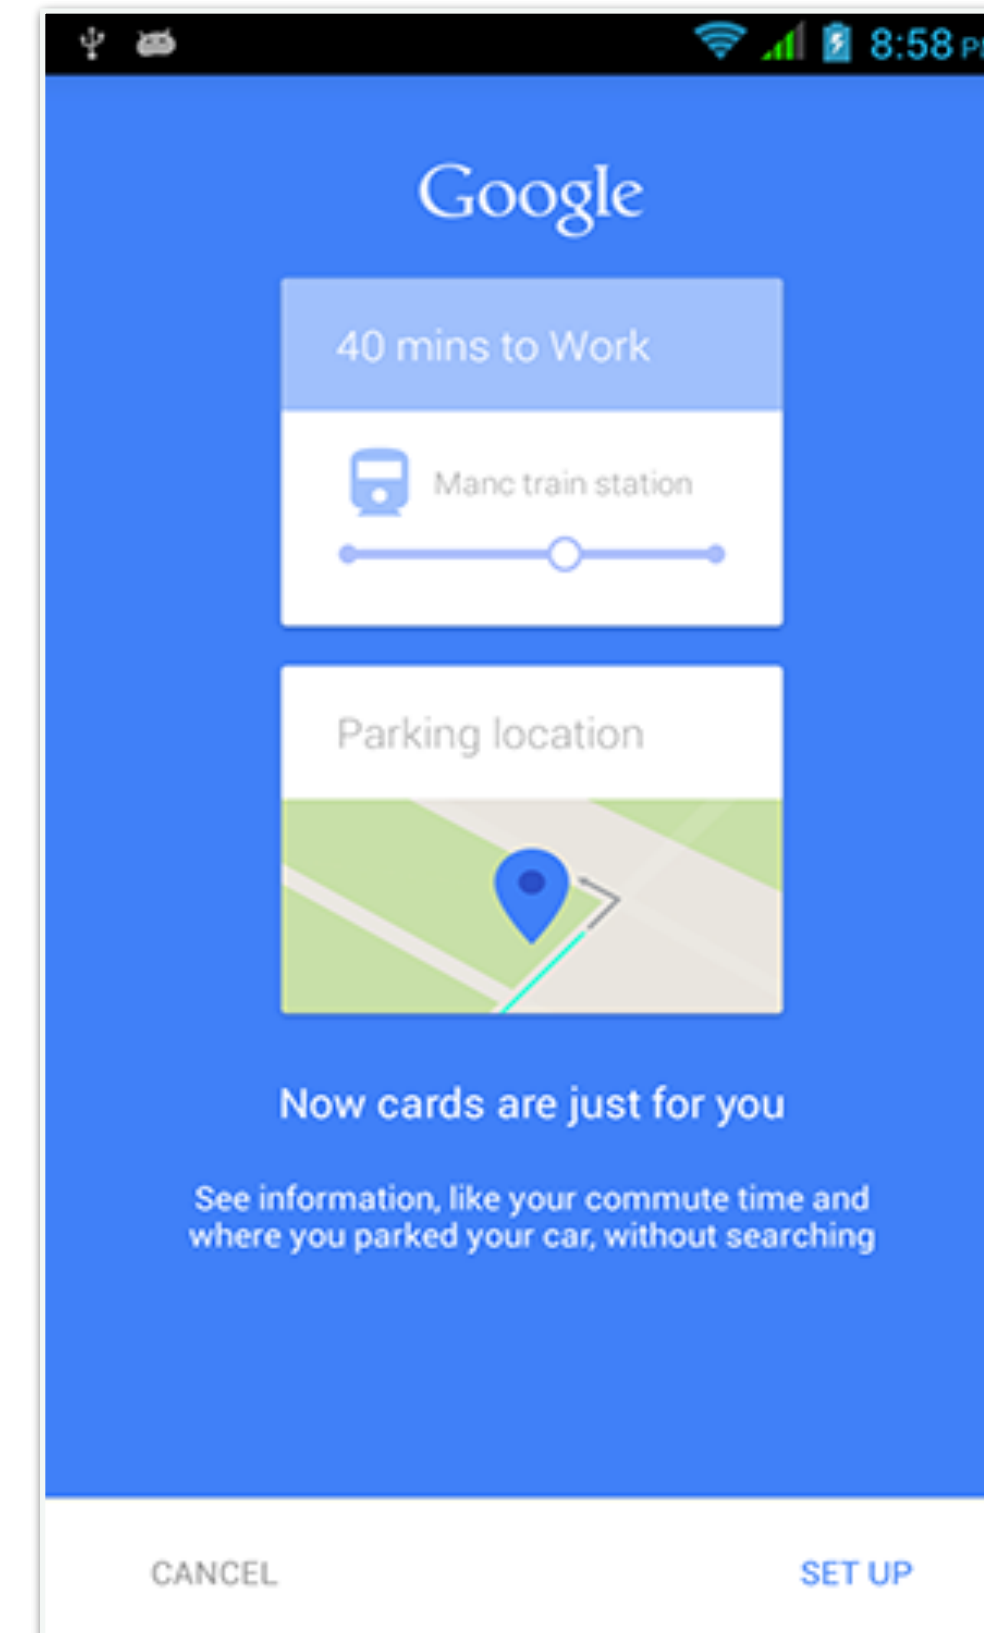

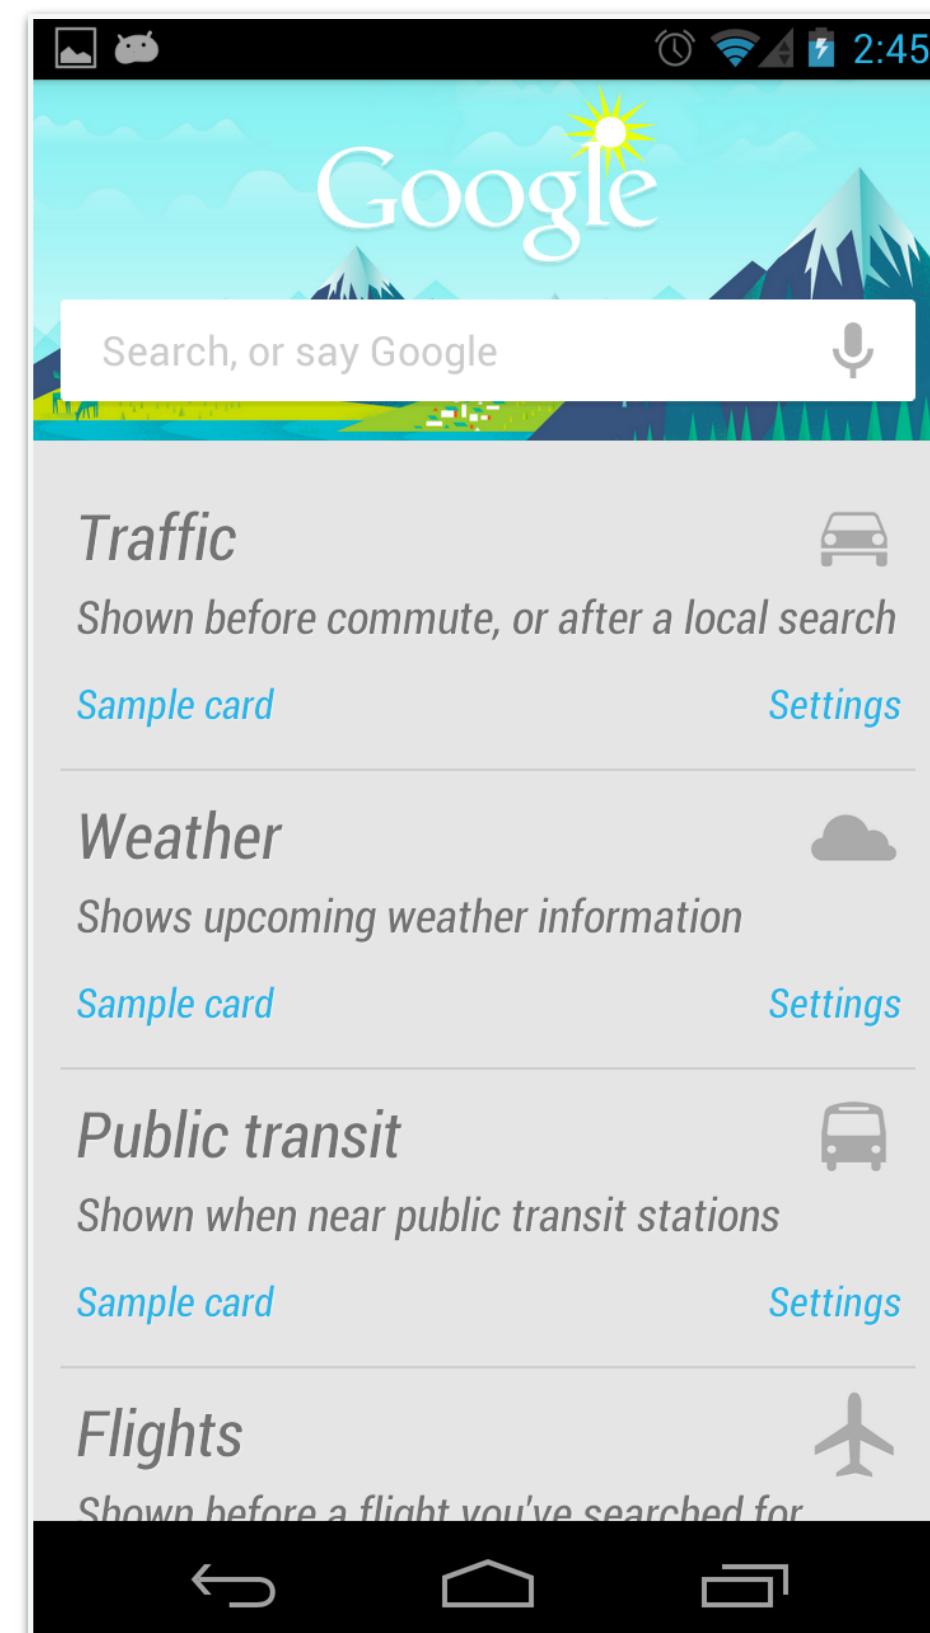

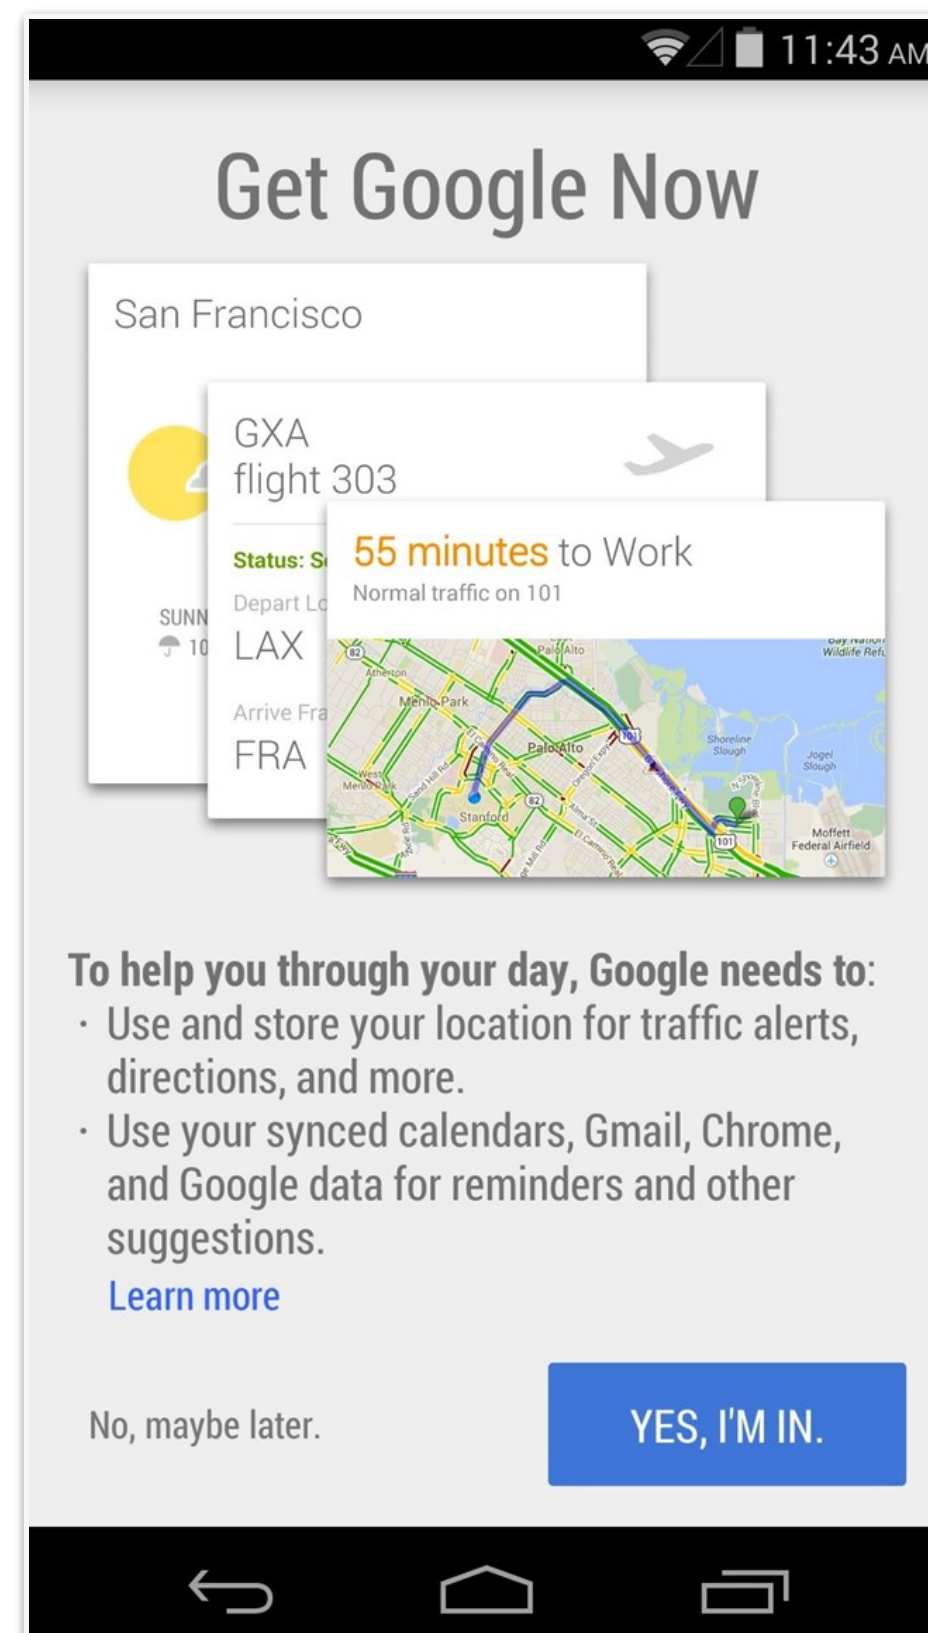

Fitness app can use weather web services to determine if running route will get rain today

Smart apps **understand**  
their user's **context**

# Google Now

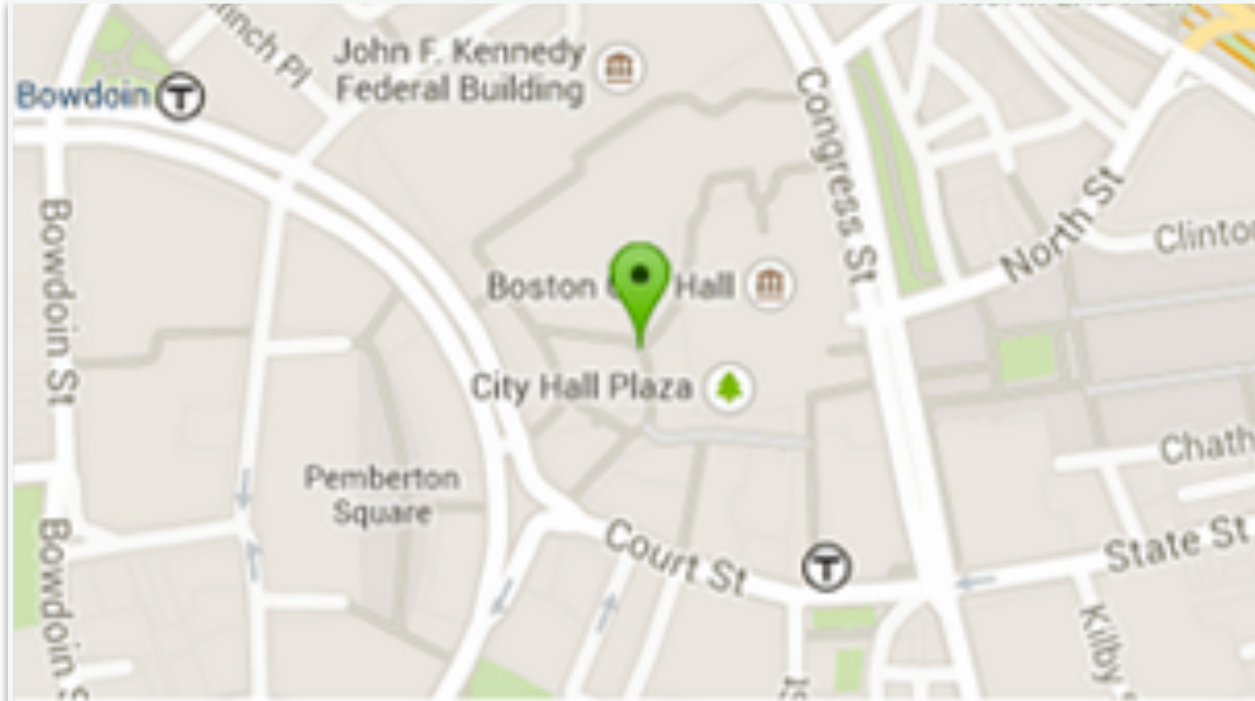

**On boarding:** Don't ask a lot of questions before getting started. And learn as you use the app. Ask for more permissions before asking for access.

# Google Now

**Assist (NOW):** Figure out how to make certain things easier. Eg: find where you parked your car.

Your Zipcar reservation ends at 2:00 PM

# Context signals

**LOCATION**

**ACTIVITY**

walk, run, in car,  
on bike, still

**CURRENT  
WEATHER**

UV Index,  
temperature,  
humidity, rain,  
sunrise & sunset

**WEATHER  
FORECAST**

10 day forecast

# Types of interactions

**ON DEMAND /  
RIGHT NOW**

**HISTORY /  
USAGE OVER  
TIME**

**PLANNING &  
RESEARCH**

# Examples

## **FITNESS**

runtastic warns it will rain in a few days when you have a run scheduled... you can also glean patterns of activity from history

## **MUSIC**

think about how UI changes for music app based on activity. e.g.: in car, don't show playlist editor, only show simple playback controls

## **ASSIST**

based on loc and/or activity, enable/disable features on phone. e.g.: disable ringer @ home. e.g.: send calls to voicemail while in vehicle

## **WEATHER**

collect prefs from user for temp ranges, rate of change, rain, UV index, for alerts... give recommendations, like bring an umbrella, or jacket

## **CLOTHING**

based on monthly collection of outfits, use weather data to suggest what outfit the user wears that day

## **YELP**

give suggestions of places based on weather, e.g.: patio seating is relevant when it's not raining or super cold or hot

## **UBER**

going to rain later today, so beware of surge pricing and maybe leave sooner or later

## **SMART CLOCK**

wake me up early because it snowed last night

## **CALENDAR**

I'm late... notify people on invite that I'm en route (by sensing activity)... suggest umbrella if bad weather

# How do I get these signals?

CoreLocation is an SDK that provides the signals for Location, Activity, Weather on iOS & Android and is available for you to use today in these awesome apps that you have designed.

# How easy is it to integrate?

To build a **production-grade** true contextual app integrating user location, user-activity with real-time environmental conditions. **What would it take?**

Without TRNQL

With TRNQL

Android App	iOS App
3 Developers	2 Developers
9 Months	3 Months
80 APIs 300 Classes 800 Methods	10 APIs 45 Classes 250 Methods
Android App	iOS App
1 Developer	1 Developer
2 Weeks	1 Week
1 API 4 Classes 10 Methods	1 API 4 Classes 10 Methods

trnql SDK manages:

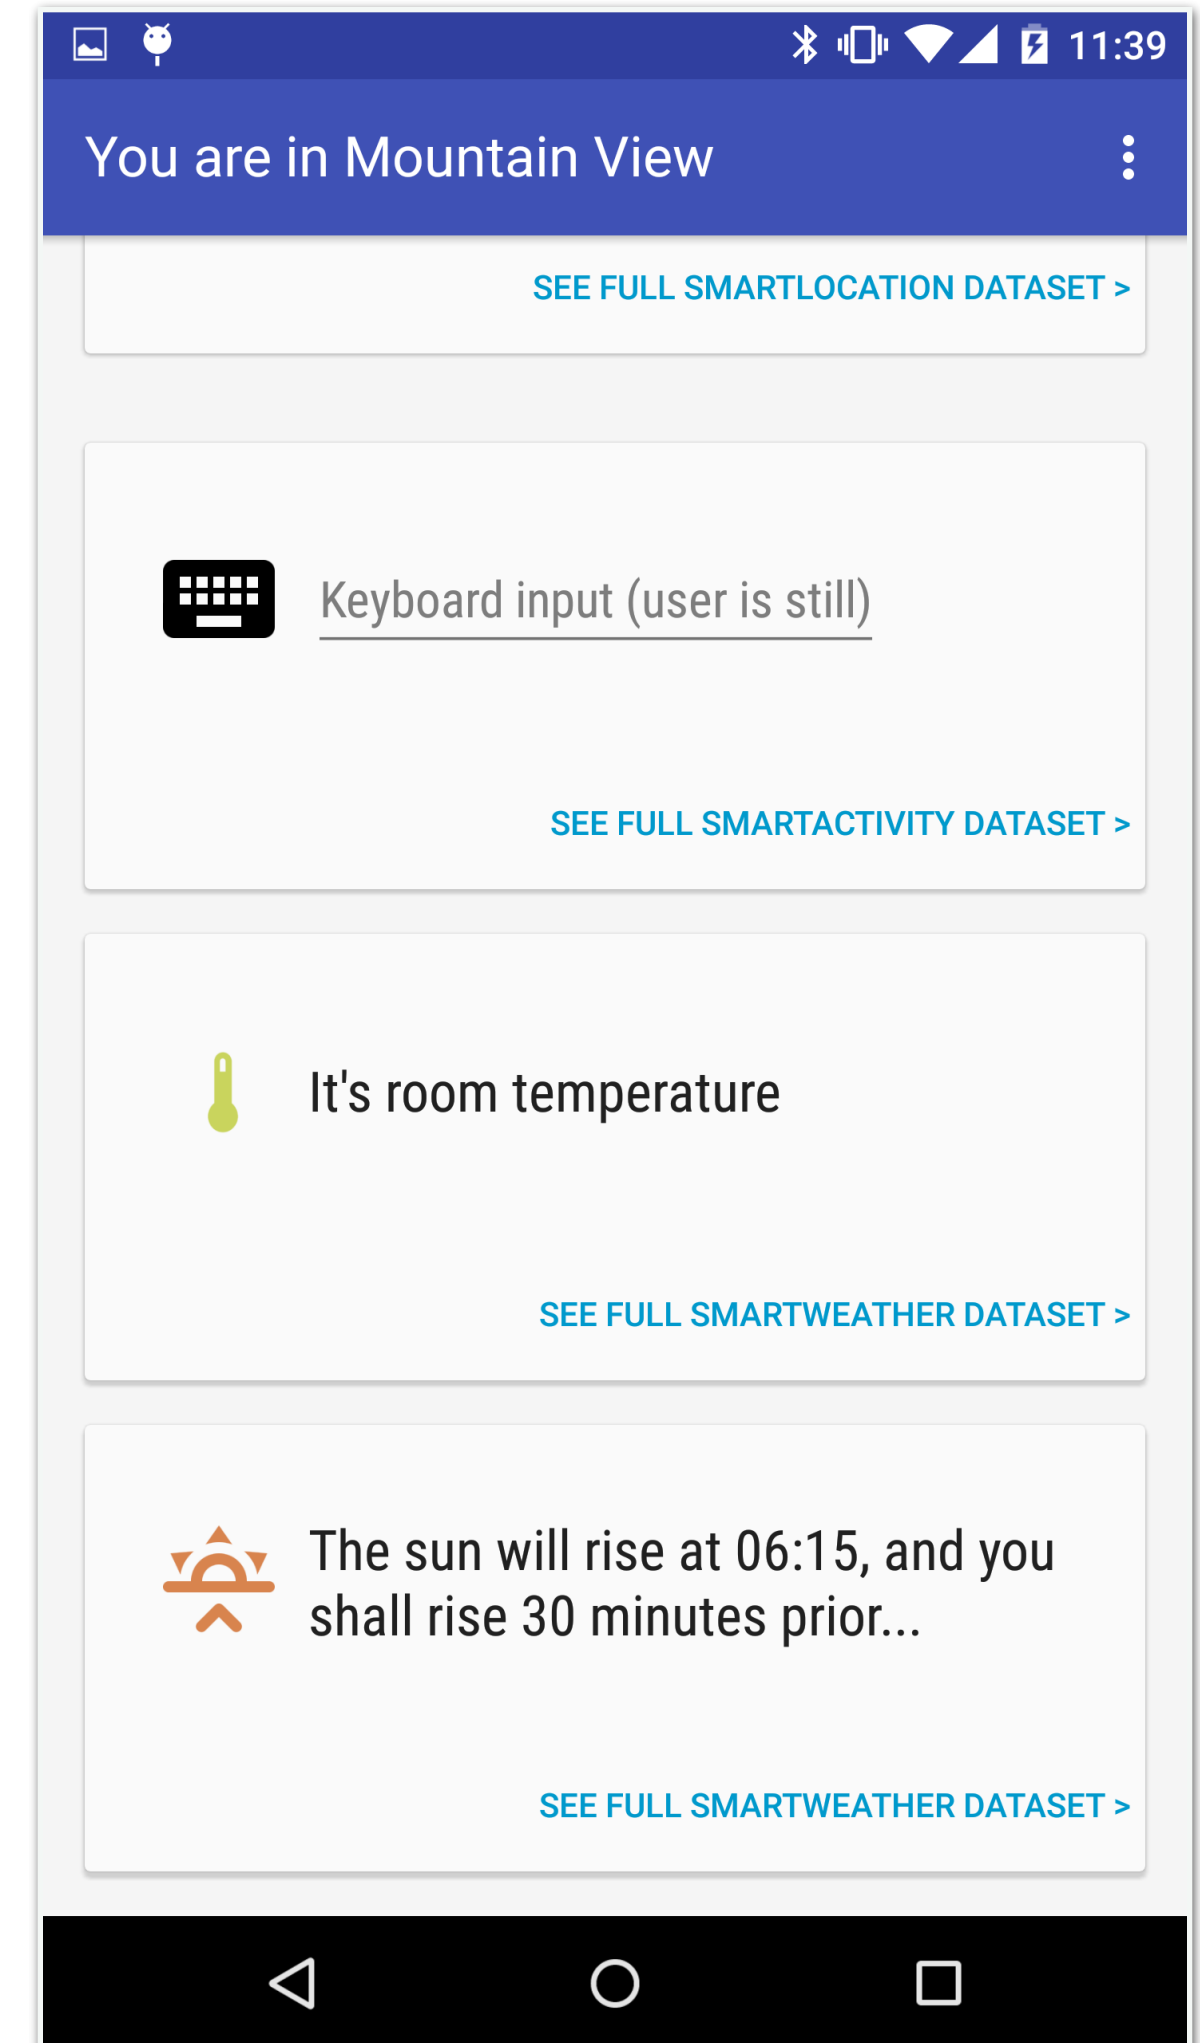

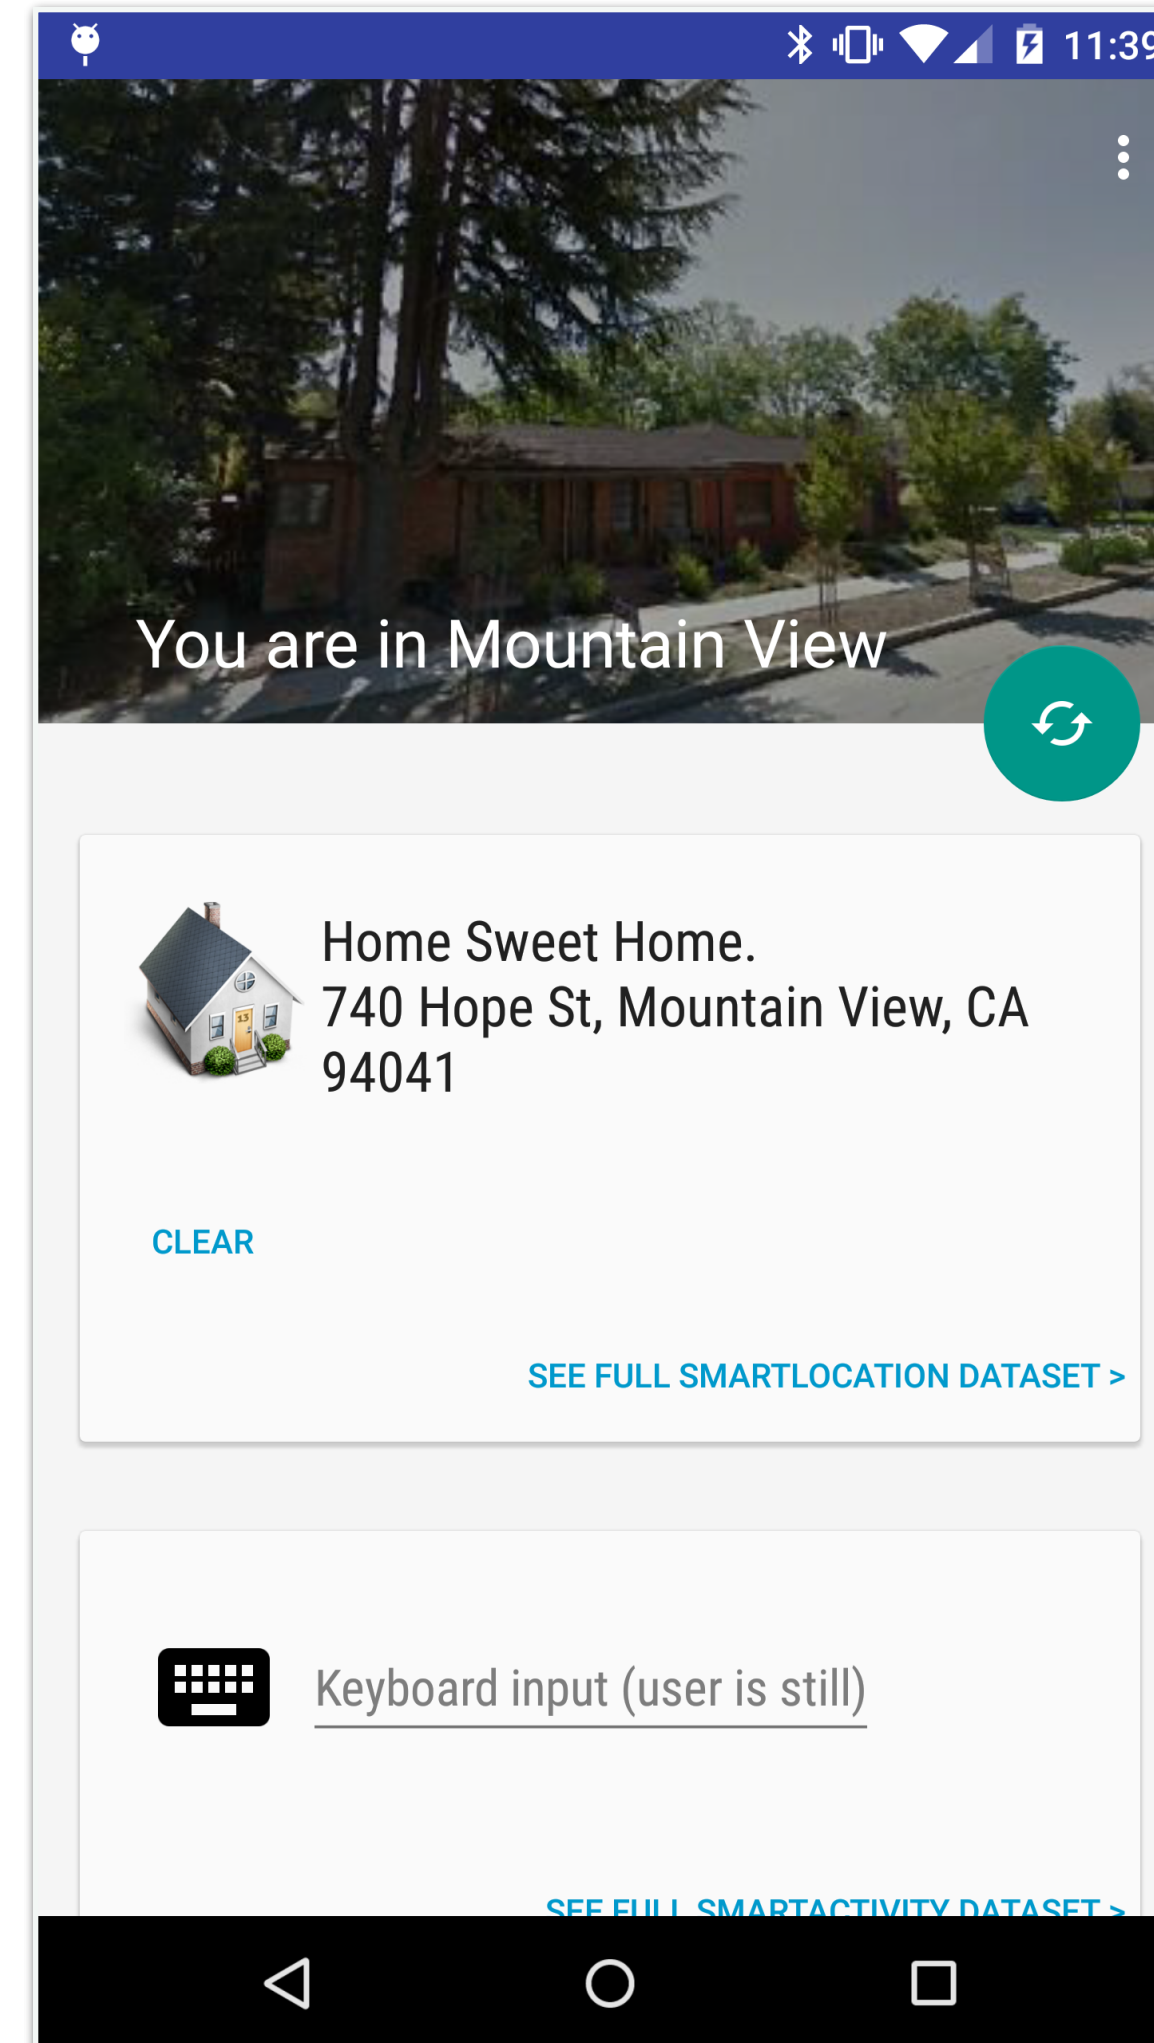

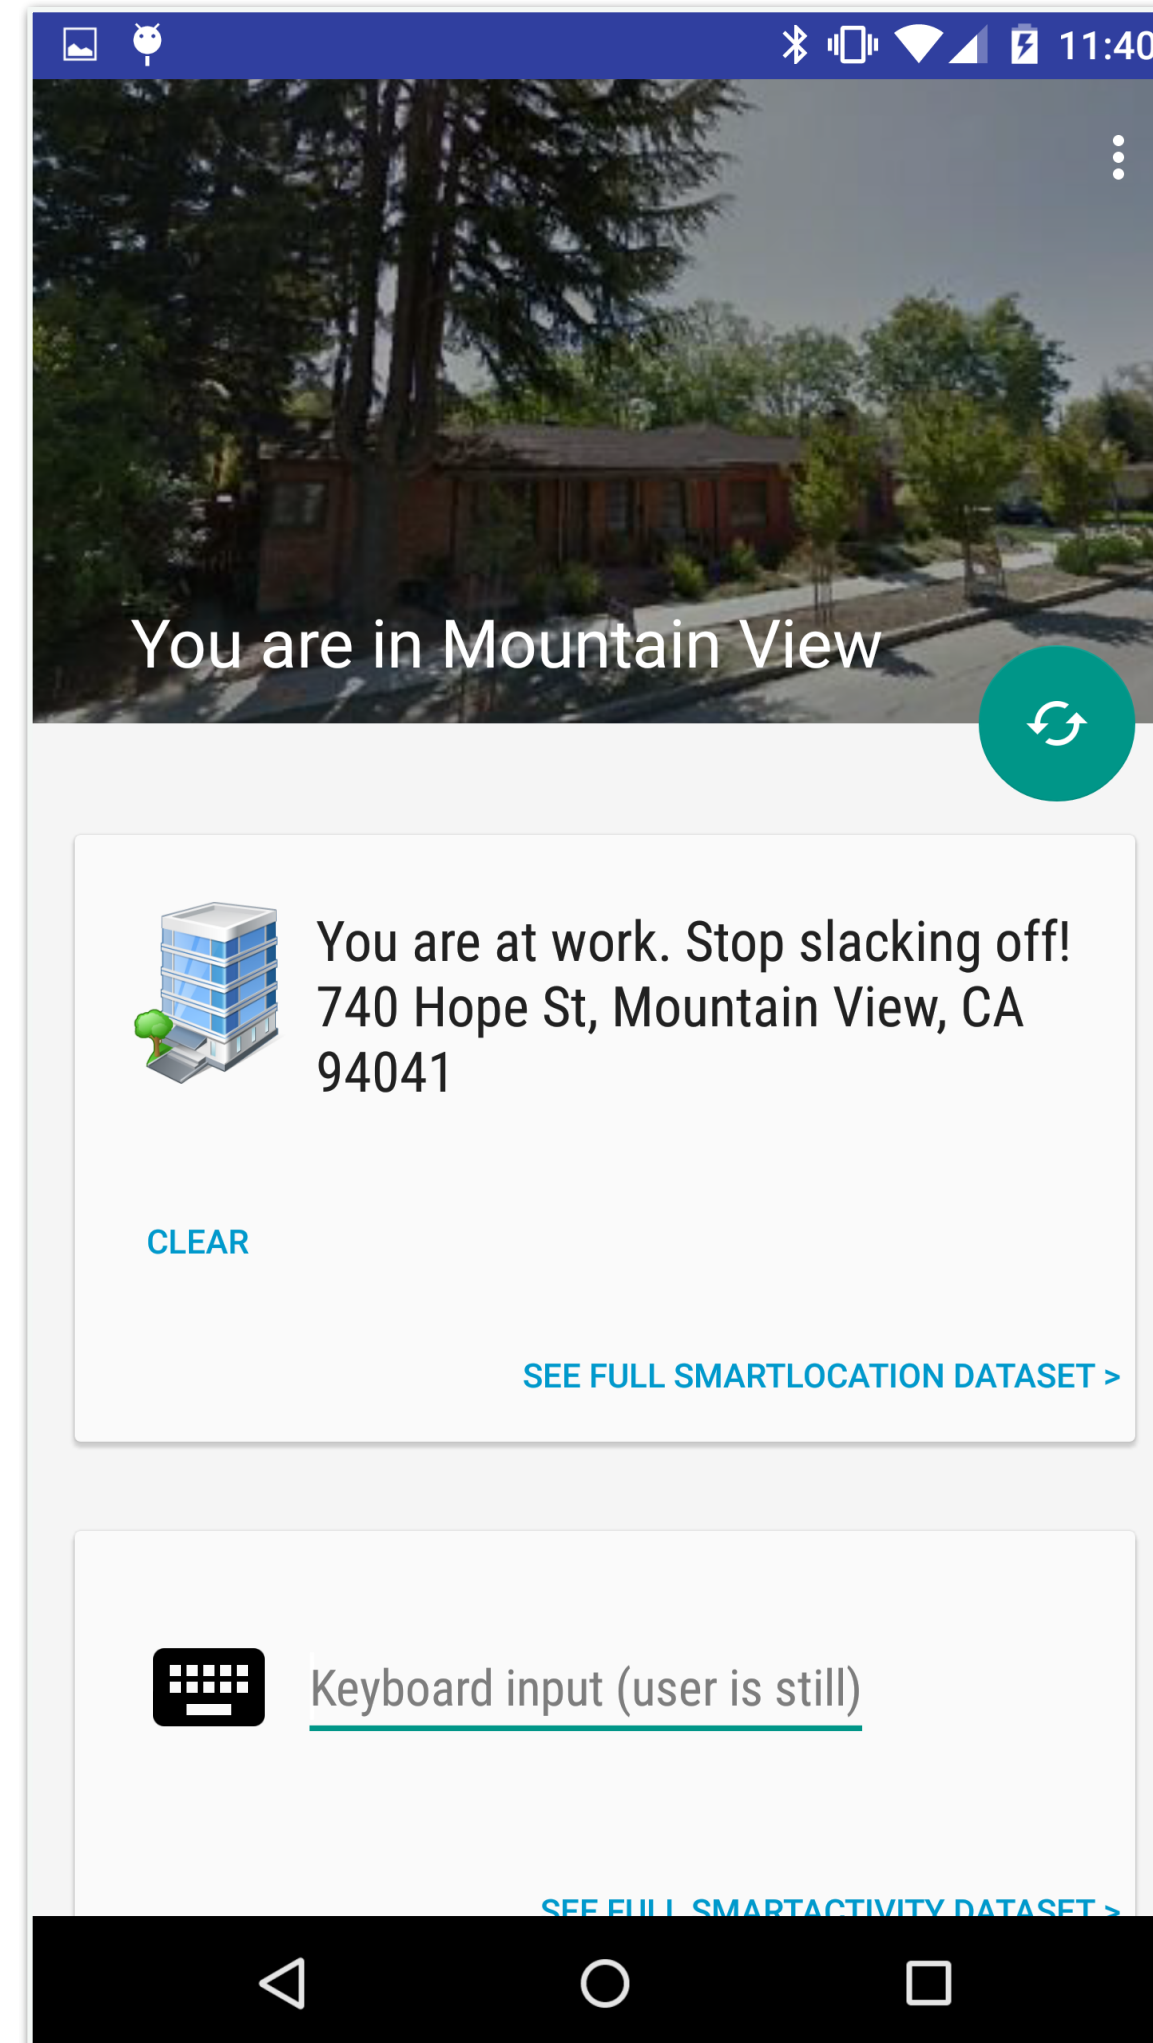

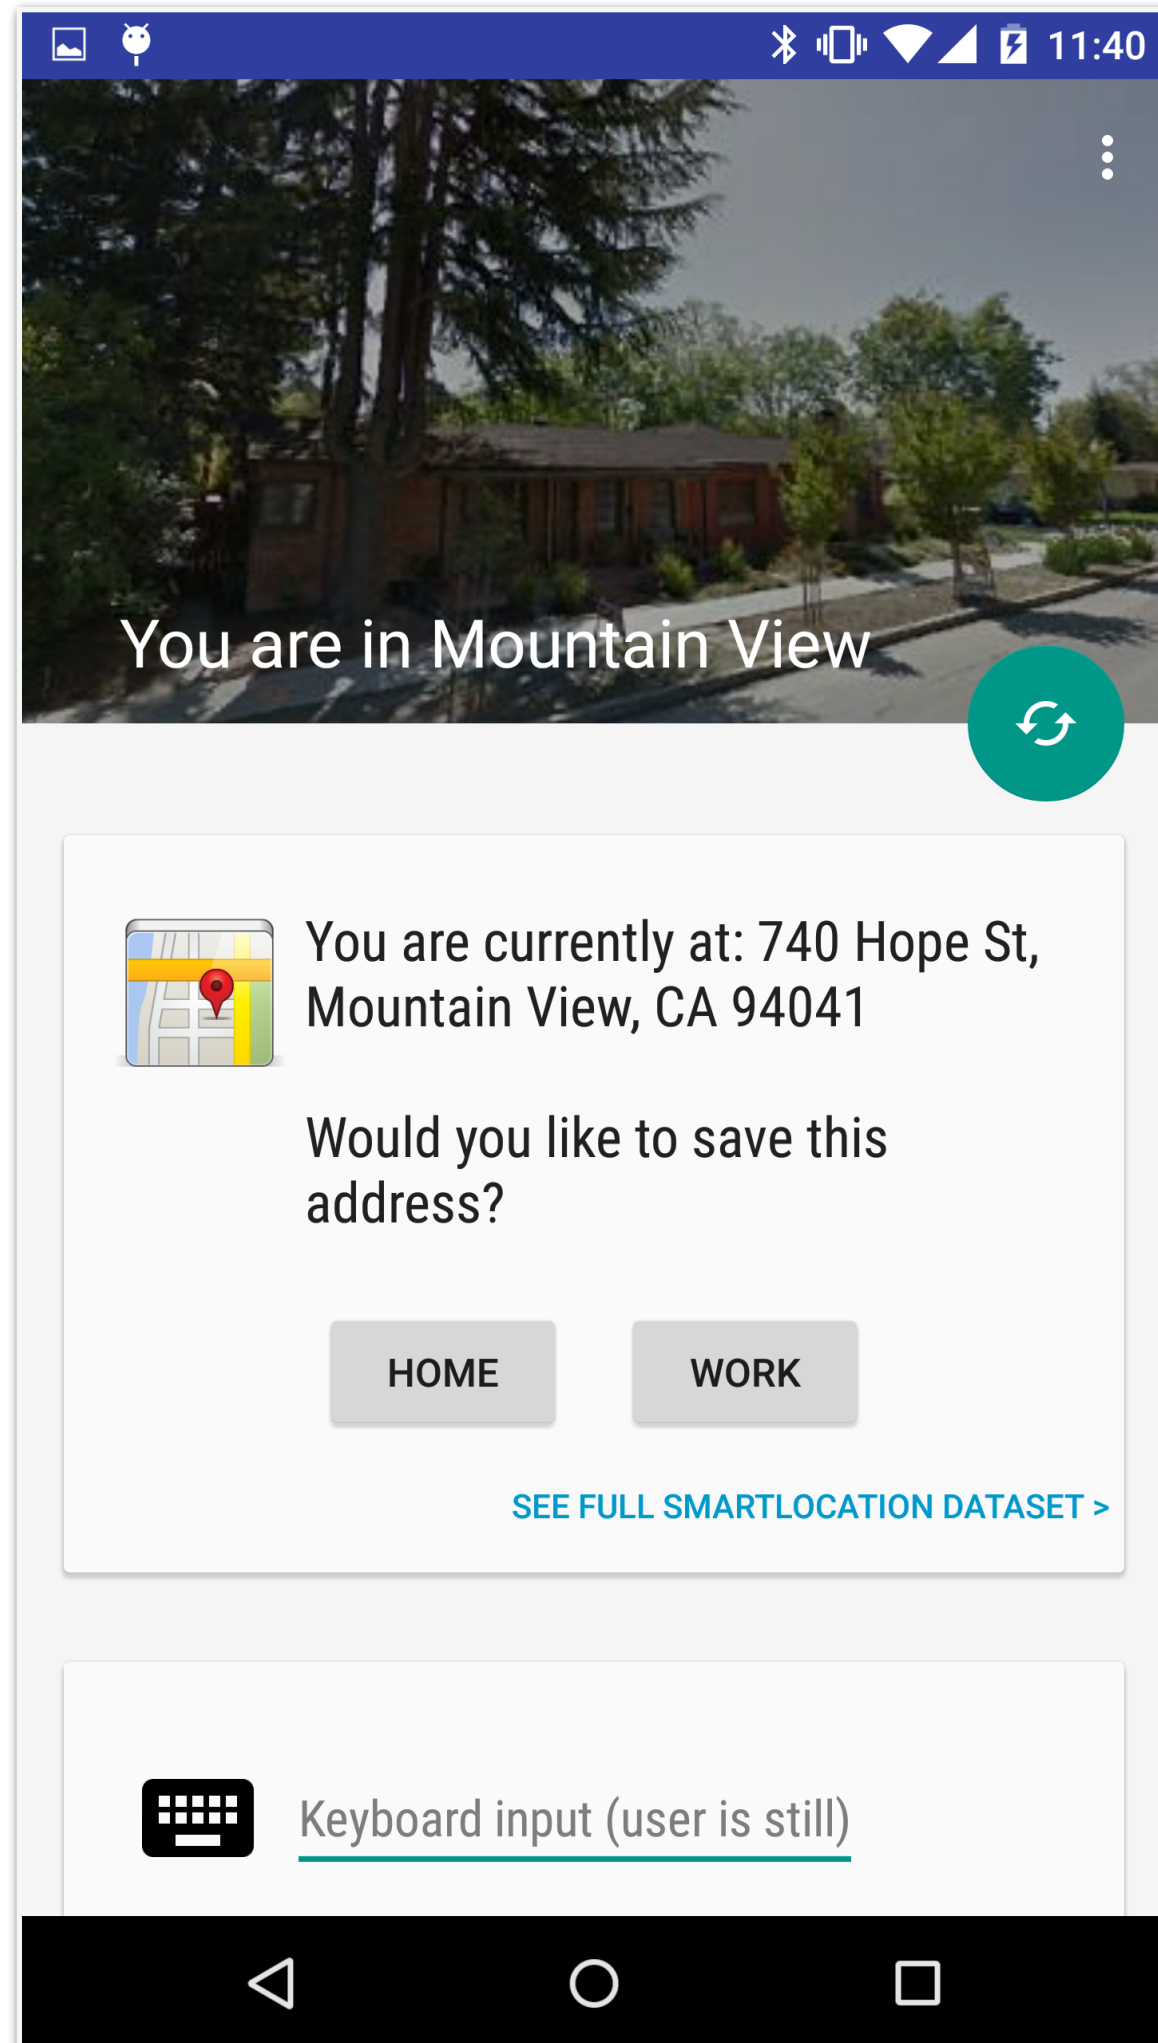

- battery & network optimization,
- efficiency & reliability of web service interactions
- server usage, recurring tasks (that run in the background on mobile & cloud)
- database caching (on mobile & cloud)
- data scrubbing (from disparate data sources on mobile & cloud)
- user permission grants
- usage analytics

# How do I get started?

trnql interplay is a sample app for iOS & Android that helps you get started. It is the skeleton of a contextual app that you can simply add more contextual cards to.

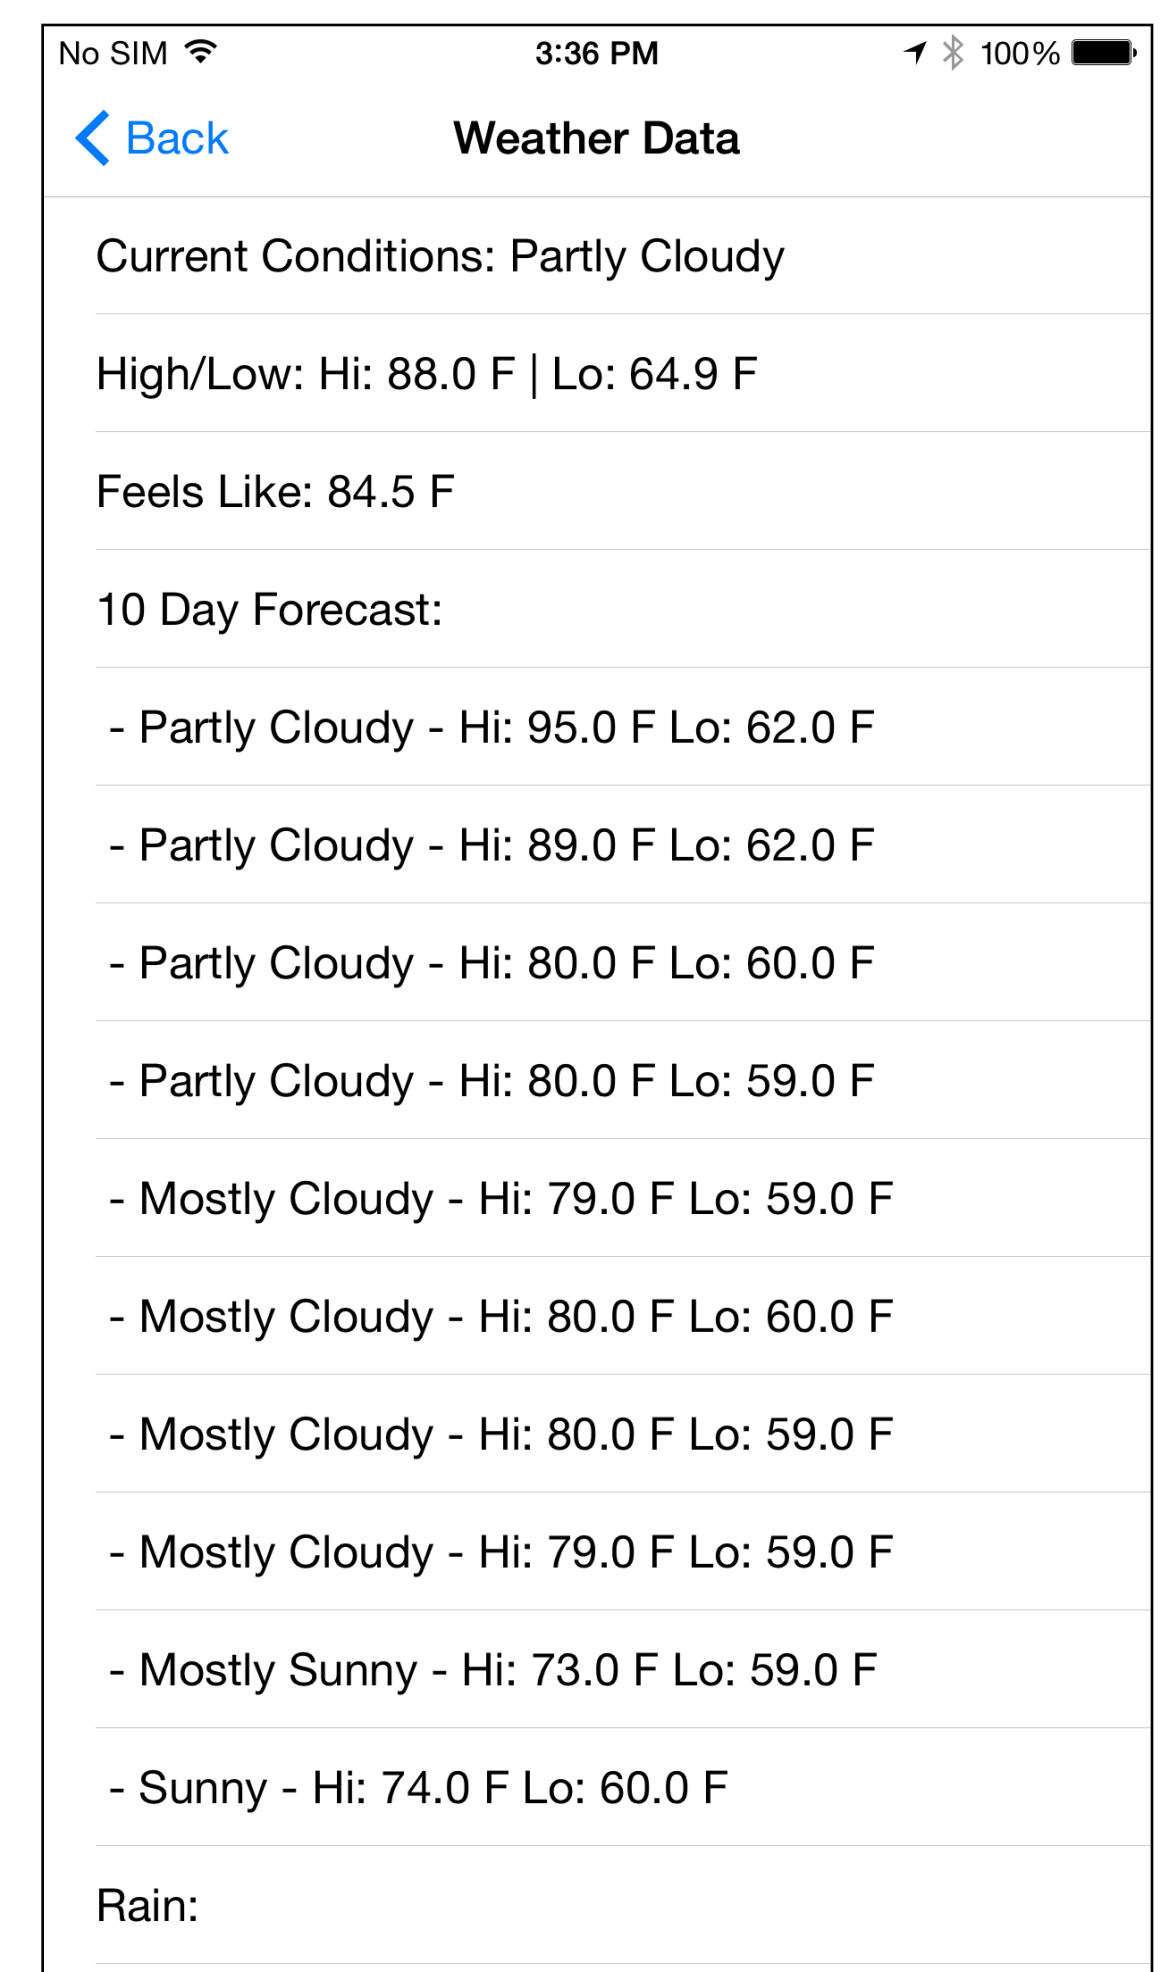

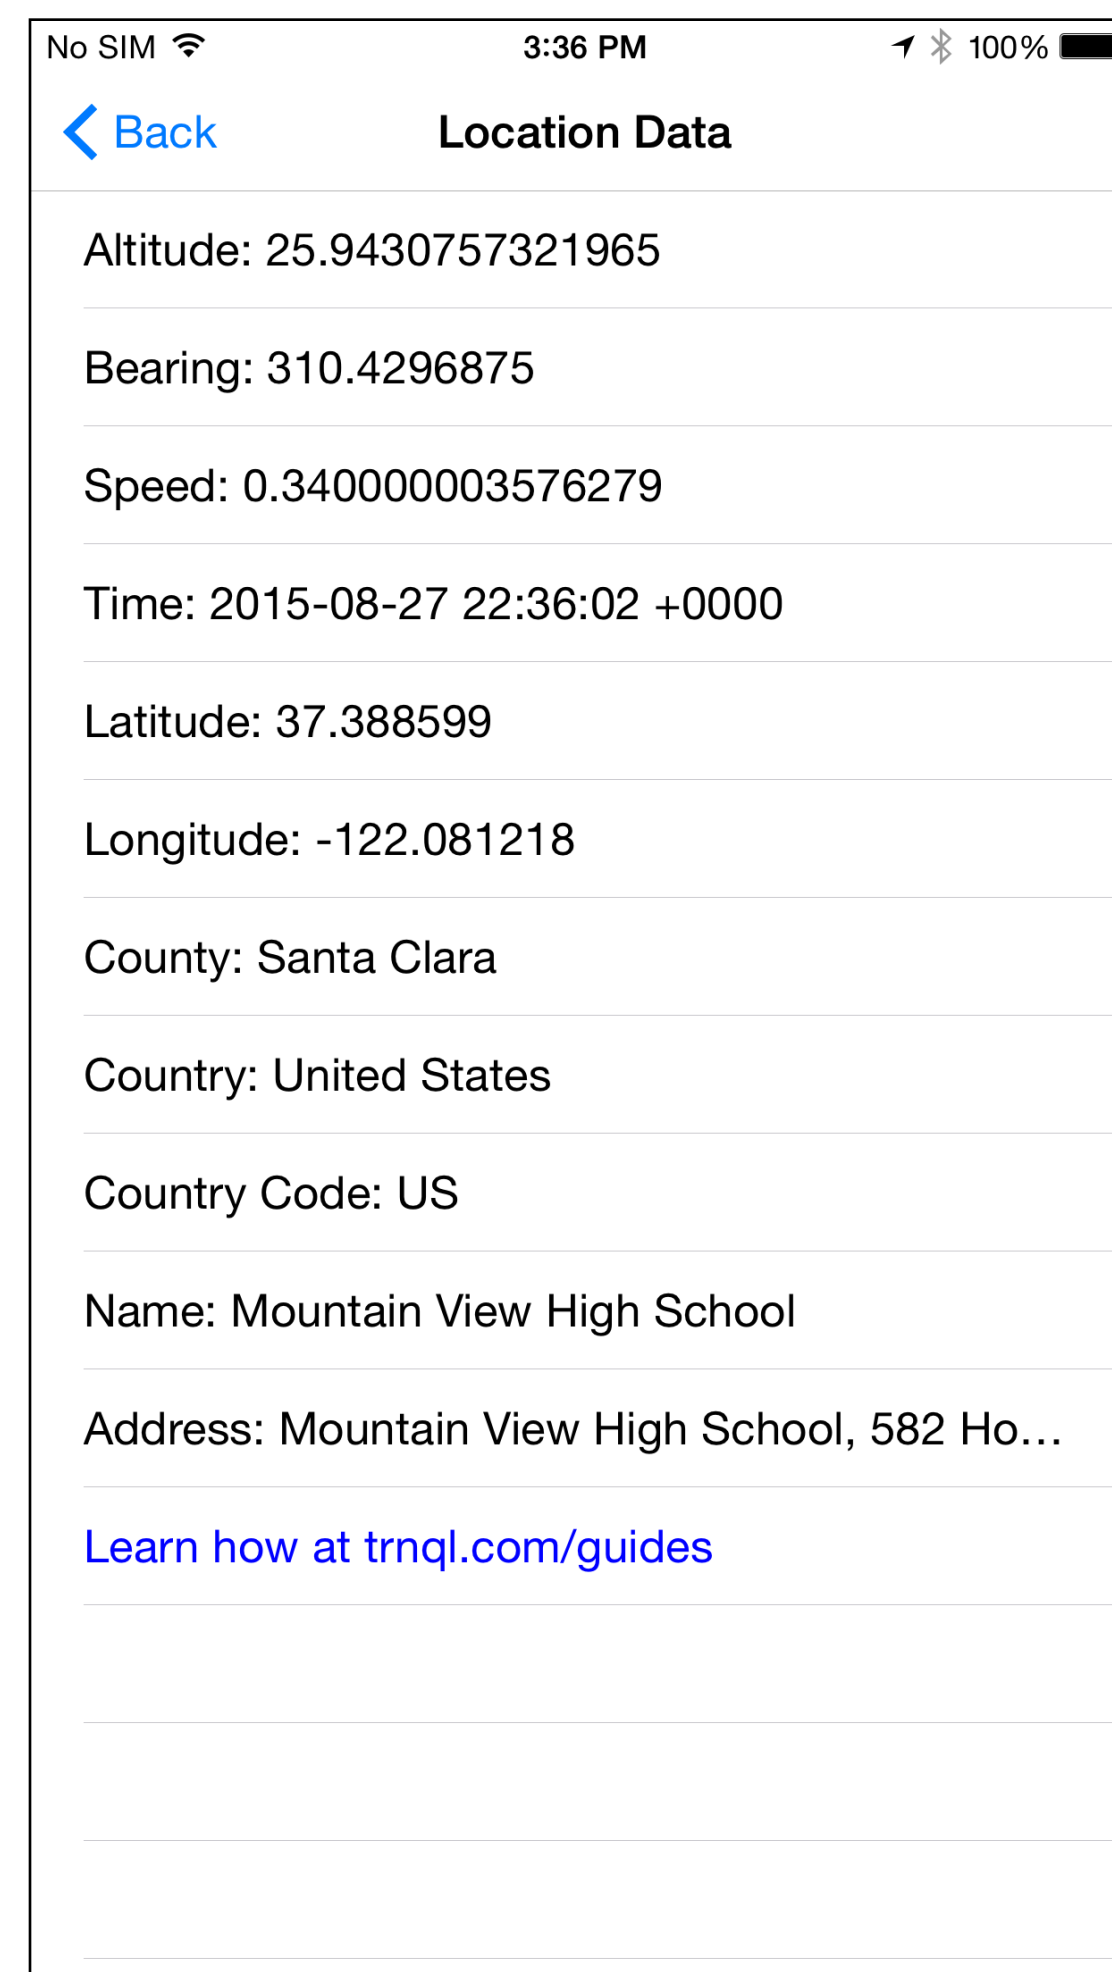

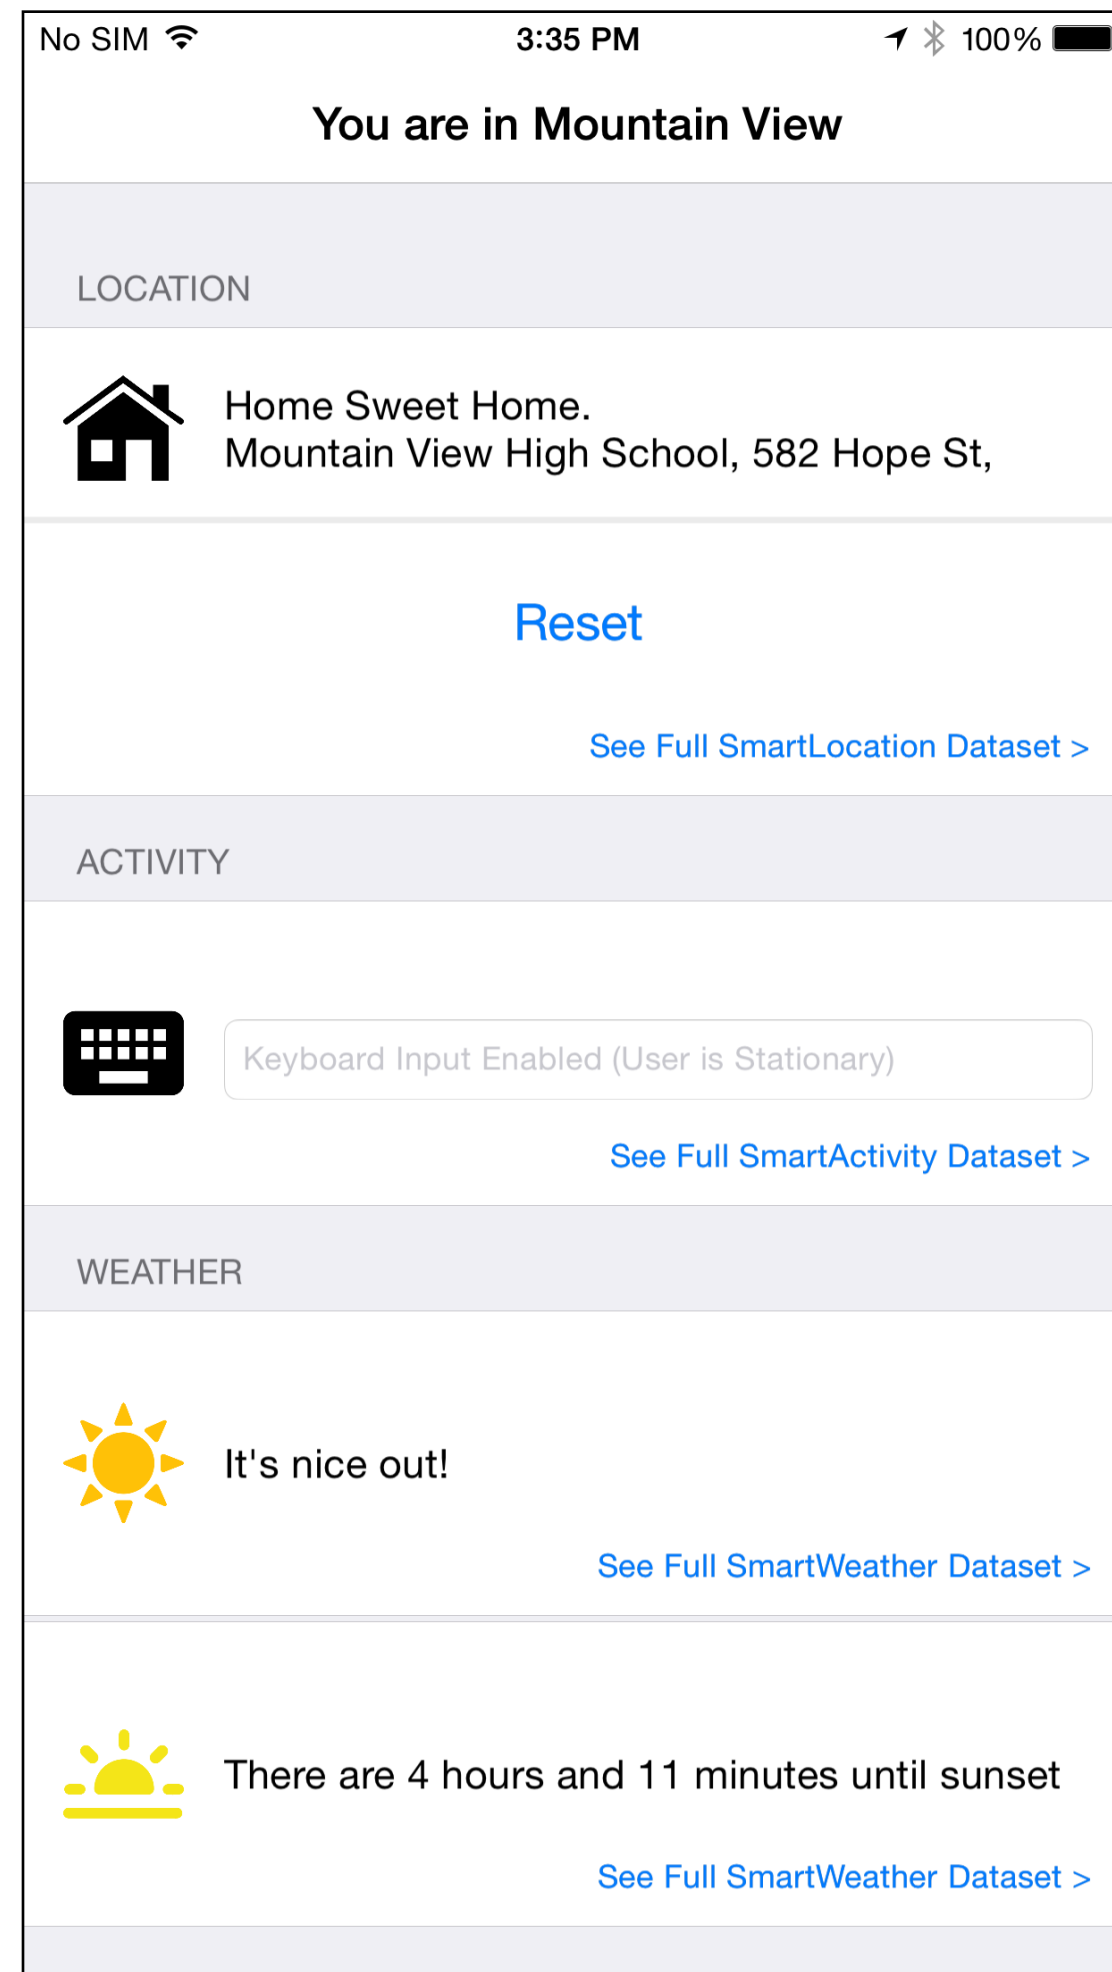

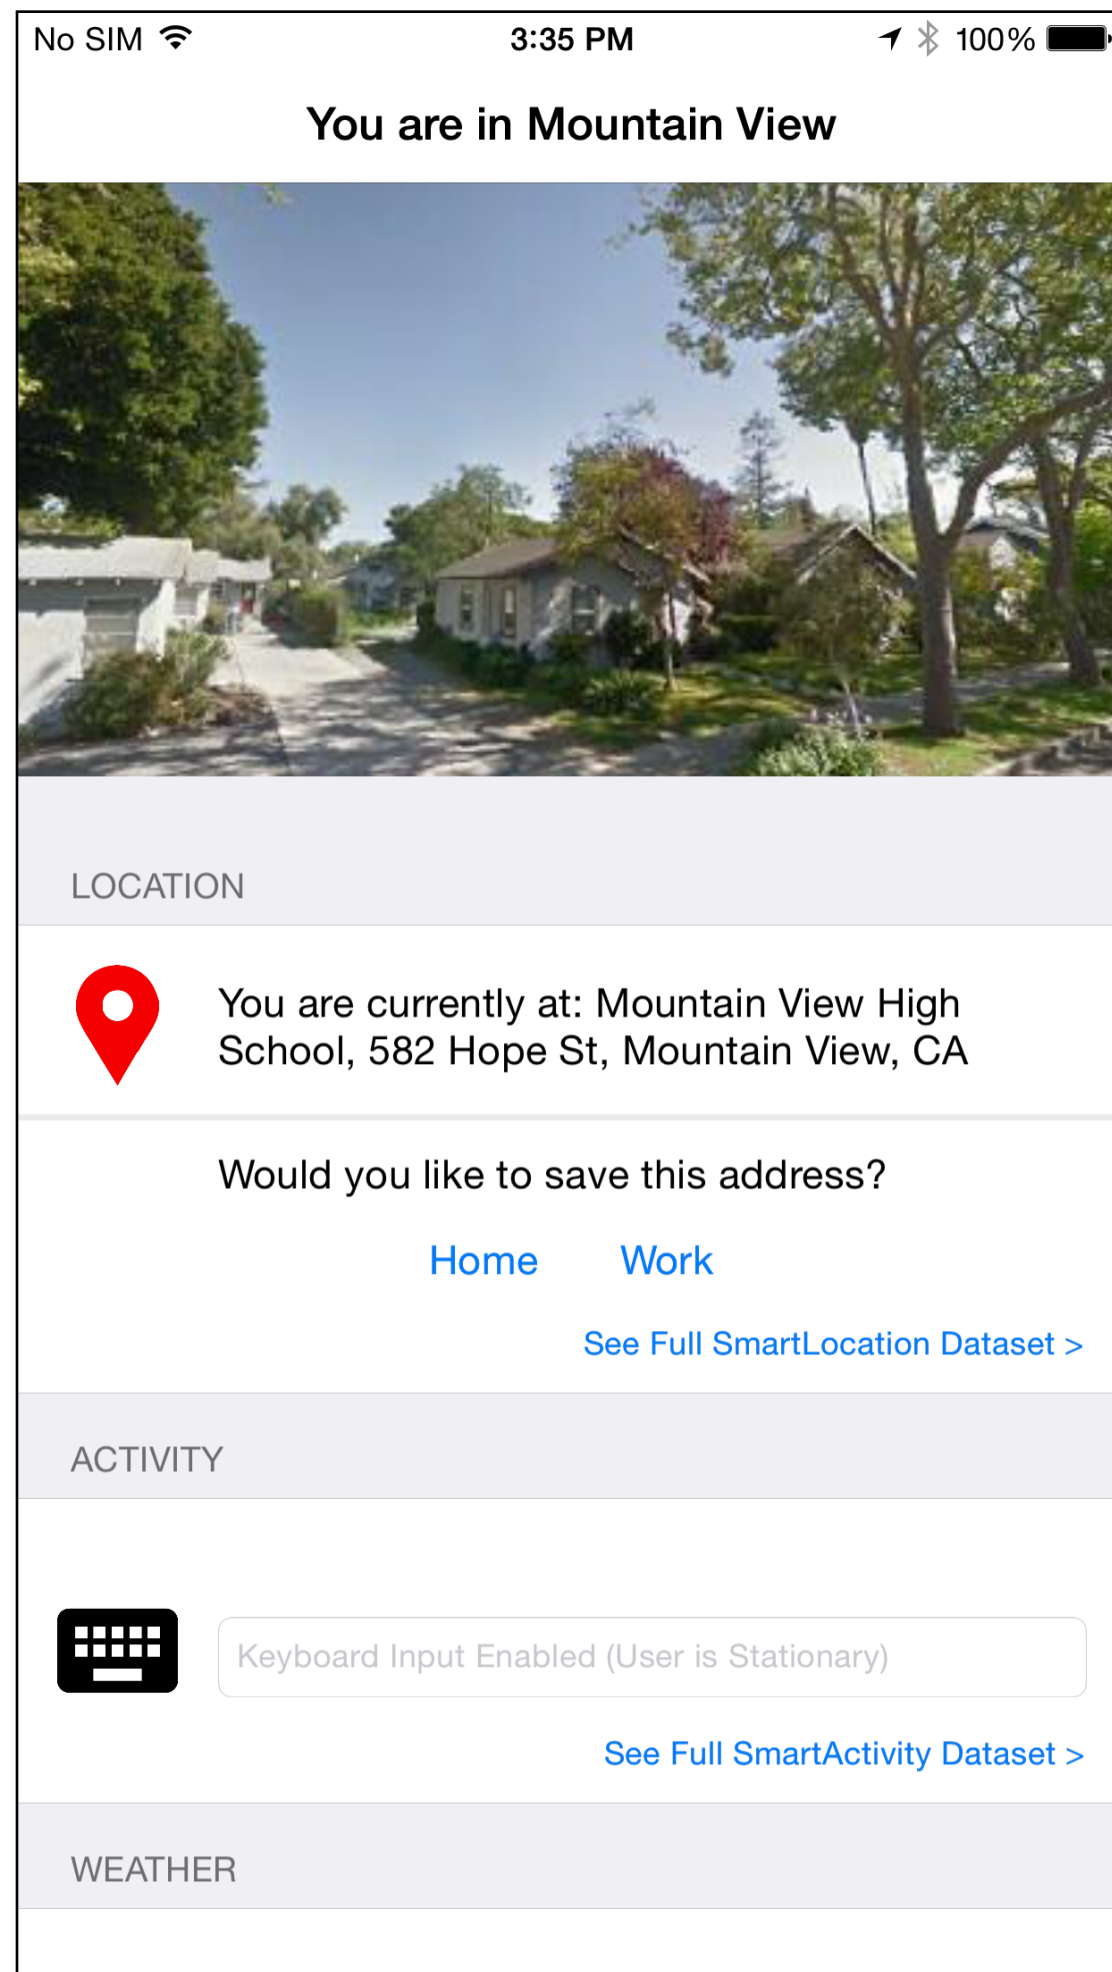

The code is available on github via Apache 2.0 license. And you are free to take the code and make it your own, and brand it to be whatever you want as you design for context.

# Download “trnql interplay” on the Google Play Store

# Download “trnql Interplay” for iOS on the App Store

# Join us!

Let us know if you need help integrating the `trnql` SDK into your iOS & Android apps

# Join us!

Show us what you've built. We will feature interesting smart apps in future meetups
